

New feature from 30th April 2010

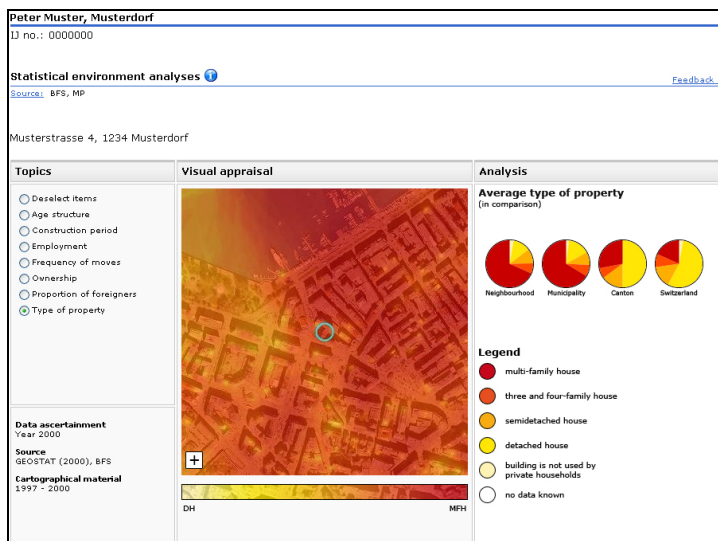

Statistical environment analysis

As a result of customer feedback, we will now be offering the geographical environment analysis for the residential property in a revised form:

Various environmental data can be depicted in an orthophoto using surface graphics, and analysed graphically. This will provide you with an idea of the environment around an individual so that this additional information can be included in your evaluation.

For transparency reasons, we have reduced the analysis to the following details:

- ➡ A map (orthophoto) of the property's environment, in two zoom levels.
- ➡ Information in the form of surface graphics about the environment around the inhabited property.
- ➡ An information graphic showing the selected data parameter as a comparison between the neighbouring area, the municipality, the Canton and Switzerland as a whole.

You can view this extension of the personal information on Teledata Standard via the relevant link by the address data.

The environmental analysis is provided free of charge. However, please contact us if you no longer require this information to be displayed.
